# Karl Fischer Titration

Honeywell offers a wide range of pyridine-free Karl Fischer reagents for both volumetric and coulometric titrations for nearly all types of samples, completed by a broad range of standards.

## Coulometry

Coulometric reagents based on different solvent compositions serve to support the broad variety of samples analyzed. Furthermore, some working techniques are supported by special reagents i.e. the use of Karl Fischer oven by Hydranal™-Coulomat AG-Oven or the use of a cell without diaphragm by Hydranal-Coulomat AD.

## Volumetry

The new formulation of Hydranal™-Composite reagents improves the stability and eliminates the formation of crystals which can interfere with the titrator's performance. Besides the most commonly used medium, dry methanol, also Hydranal-Methanol Rapid containing accelerators, less toxic ethanol based media (E-type) as well as methanol-free media for ketones and aldehydes (K-types) have been developed.

## Water Standards

Hydranal™-Water Standards are designed for calibration, validation and inspection of analytical instruments and reagents. With the double accreditation (ISO/IEC 17025 and ISO Guide 34), Hydranal introduced the very first commercially available CRM (Certified Reference Material) Water Standards for Karl Fischer titration.

# Oligo and Peptide Synthesis

Solvents and reagents used in the synthesis of biological molecules, oligonucleotides, peptides and organics. These products have very low levels of impurities, moisture content and particulates, ensuring the highest yield of the desired finished product.

## BioSyn™ Reagents

Reagents for use in oligonucleotide and peptide synthesis. These reagents are processed, purified and manufactured to exacting specifications to ensure highest synthesis efficiency. The portfolio includes a variety of reagent dispenser options so that the synthesizers can be directly connected to larger-volume containers to allow the instrument to run continuously over longer periods of time.

## BioSyn™ Solvents

Solvents used for synthesis of new molecules, oligonucleotides and peptides. Impurities are analyzed and characterized to enhance the purification process and eliminate them, resulting in high-purity, low-water content solvents.
